✓ 1. What is destructuring in React.js? *

1/1

- ☐ A way to split a string into an array of characters.
- ☒ A way to assign values from arrays or objects to variables. ✓
- ☐ A way to clone objects and arrays.
- ☐ A way to create nested components in React.

✓ 2. What is the purpose of the spread operator (...) in React.js? *

1/1

- ☒ To quickly copy all or part of an existing array or object into another array or object. ✓
- ☐ To assign default values to component props.
- ☐ To define a variable with multiple values.
- ☐ A way to clone objects and arrays.

✓ 3. What does the map operator do in React.js? *

1/1

- ☐ It converts an array of JSX elements into a single JSX element.
- ☒ It applies a function to each element in an array and returns a new array. ✓
- ☐ It sorts an array of objects based on a specified property.
- ☐ It removes duplicate elements from an array.

✓ 4. How is the map operator used in React.js to render a list of elements? * 1/1

- ☒ {array.map(item => <Item key={item.id} />)} ✓
- ☐ {map(array, item => <Item key={item.id} />)}
- ☐ {array.map(item, index => <Item key={index} />)}
- ☐ {map.array(item => <Item key={item.id} />)}

✓ 5. How is destructuring used to assign values from an array to variables? * 1/1

- ☒ const [variable1, variable2] = array; ✓
- ☐ const { variable1, variable2 } = array;
- ☐ const [variable1: variable2] = array;
- ☐ const { variable1: variable2 } = array;

✓ 6. How can the spread operator be used to clone an object in React.js? * 1/1

- ☒ `const clonedObject = {...originalObject};`
- ☐ `const clonedObject = originalObject.clone();`
- ☐ `const clonedObject = originalObject.copy();`
- ☐ `const clonedObject = originalObject.spread();`

✓ 7. What is the purpose of using the map operator instead of a regular for loop in React.js? *1/1

- ☐ It is faster and more efficient.
- ☒ It allows for easier iteration over arrays and objects.
- ☐ It supports asynchronous operations.
- ☐ It automatically handles error handling in iteration.

✓ 8. What is the key difference between stateful and stateless components *1/1 in React?

- ☒ Stateful components can manage internal state, while stateless components cannot.
- ☐ Stateful components are defined as classes, while stateless components are defined as functions.
- ☐ Stateful components have lifecycle methods, while stateless components do not.
- ☐ Stateful components can receive and handle props, while stateless components cannot.

✓ 9. Which hook is used to manage state in functional components in React? *1/1

- ☒ useState
- ☐ useEffect
- ☐ useReducer
- ☐ useContext

✗ 10. How is the useState hook used in React to manage state? * 0/1

- ☐ let state = useState(initialState);
- ☐ let [state] = useState(initialState);
- ☐ let [state, setState] = useState(initialState);
- ☒ let { state, setState } = useState(initialState);

Correct answer

- ☒ let [state, setState] = useState(initialState);
